(Национальный Исследовательский Университет)

Факультет информационных технологий и прикладной математики
Кафедра вычислительной математики и программирования

Лабораторная работа №6
по курсу «Операционные системы»
III Семестр

Вариант 29

Студент:	Короткевич Л. В.
Группа:	М80-208Б-19
Преподаватель:	Миронов Е.С
Оценка:	
Дата:	

1. Постановка задачи. Вариант 29.

Реализовать распределенную систему по асинхронной обработке запросов. В данной распределенной системе должно существовать 2 вида узлов: «управляющий» и «вычислительный». Необходимо объединить данные узлы в соответствии с той топологией, которая определена вариантом. Связь между узлами необходимо осуществить при помощи технологии очередей сообщений. Также в данной системе необходимо предусмотреть проверку доступности узлов в соответствии с вариантом. При убийстве («kill -9») любого вычислительного узла система должна пытаться максимально сохранять свою работоспособность, а именно все дочерние узлы убитого узла могут стать недоступными, но родительские узлы должны сохранить свою работоспособность. Управляющий узел отвечает за ввод команд от пользователя и отправку этих команд на вычислительные узлы. Список основных поддерживаемых команд:

- Создание нового вычислительного узла
- Удаление существующего вычислительного узла
- Исполнение команды на вычислительном узле

Вариант 29: топология – бинарное дерево, команда – словарь, проверка доступности – ping id.

2. Метод решения.

Используемые методы и системные вызовы для выполнения работы:

context_t::context_t(int io_threads)	Сопоставляется с функцией zmq_init (), как описано в zmq_init(3).
socket_t::socket_t(context_t &context, int type)	Сопоставляется с функцией zmq_socket (), как описано в zmq_socket(3).
void *zmq_init (int io_threads);	Функция zmq_init () инициализирует контекст ØMQ.
void *zmq_socket (void *context, int type);	Создать сокет ØMQ
int zmq_setsockopt (void *socket, int option_name, const void *option_value, size_t option_len);	Установить параметры сокета ØMQ
int zmq_bind (void *socket, const char *endpoint);	Функция zmq_bind () создает конечную точку для приема соединений и привязывает ее к сокету, на который ссылается аргумент socket.
int execv(const char *path, char *const argv[]);	Семейство функций exec () заменяет текущий образ процесса новым образом

	процесса.
<code>void *memcpy(void *dest, const void *src, size_t n);</code>	Функция <code>memcpy()</code> копирует <code>n</code> байтов из области памяти <code>src</code> в область памяти <code>dest</code> . Области памяти не могут пересекаться. Используйте <code>memmove(3)</code> , если области памяти перекрываются.
<code>int kill(pid_t pid, int sig);</code>	<code>kill</code> - посылает сигнал процессу:
сигнал SIGTERM	запрашивает остановку работы процесса. Он может быть проигнорирован. Процессу дается время на корректное завершение. Если программа завершается корректно, значит она использовала данное время на то, чтобы сохранить свое состояние или результаты работы и освободить ресурсы. Другими словами, ее не заставляли остановиться.
сигнал SIGKILL	заставляет процесс прекратить работу немедленно. Программа не может проигнорировать этот сигнал. Несохранные результаты будут потеряны.
<code>int zmq_recv (void *socket, zmq_msg_t *msg, int flags);</code>	Функция <code>zmq_recv ()</code> должна получить сообщение от сокета, на который ссылается аргумент <code>socket</code> , и сохранить его в сообщении, на которое ссылается аргумент <code>msg</code> .

Программа состоит из двух файлов, представляющих управляющий и вычислительные узлы, а также из двух библиотек: первая, `server.hpp`, описывает взаимодействие между узлами; вторая, `tree.hpp`, описывает бинарное дерево.

Работа программы обуславливается следующей логикой: управляющий узел обрабатывает поступающие запросы, после чего пересылает их дочерним узлам (или выводит сообщение об ошибке). Затем по мере получения команды дочерними узлами, они посылают ее дальше в один из низлежащих узлов, из которого затем возвращается сообщение об ошибке или успехе, которое потом посылается вверх по дереву.

Проверка узлов на доступность зиждется на топологии дерева: удаление определенной ноды влечет рекурсивное уничтожение ее детей. Если же узел оказался недоступен, то по истечении времени (`SNDTIMEO`) будет получено сообщение о его состоянии, которое затем отправится вверх по дереву до самого управляющего узла.

3. Тестирование

Тест №1: проверка общей работоспособности программы, всех операций.

leoub@leoub-VirtualBox:~/MEGAsync/ver_src6_final\$./main

```
> create 1
OK:91521
> create 2
OK:91525
> create 3
OK:91529
> pingall
Received nodes: 1 2 3
Nodes list: 1 2 3
> remove 2
OK
> pingall
Received nodes: 1
Nodes list: 1
> ping 1
OK:1
> ping 2
Error: Not found
> exec 1 + test 1
OK:1
> exec 1 ? test
OK:1: 1
> remove 1
OK
> ping 1
Error: Not found
> pingall
Error: Tree is empty
> exit
```

Тест №2: удаление большого кол-ва последовательных узлов.

leoub@leoub-VirtualBox:~/MEGAsync/ver_src6_final\$./main

```
> create 1
OK:91547
> create 2
OK:91552
> create 3
OK:91556
> create 4
OK:91560
> create 5
OK:91564
> create 6
OK:91568
> pingall
Received nodes: 1 2 3 4 5 6
```

Nodes list: 1 2 3 4 5 6

> remove 3

OK

> pingall

Received nodes: 1 2

Nodes list: 1 2

> ping 3

Error: Not found

> ping 2

OK:1

> exit

Тест №3: удаление корня.

leoub@leoub-VirtualBox:~/MEGAsync/ver_src6_final\$./main

> create 1

OK:91658

> ping 1

OK:1

> remove 1

OK

> ping 1

Error: Not found

> pingall

Error: Tree is empty

> exit

5. Выводы

По мере выполнения данной лабораторной работы я освоил большое количество навыков: в первую очередь, научился работать с очередями сообщений. На примере библиотеки ZeroMQ я описал взаимодействие между двумя разными программами с помощью неё.

Также я описал бинарное дерево с поддержкой различных операций, в том числе — хранение в узлах дерева словаря. Это было нетрудно, благо, в STL существует контейнер `unordered_map`, позволяющий производить все необходимые для работы со словарём операции быстро и эффективно.

Помимо всего этого, удалось реализовать два вида проверки доступности узлов — `ping id` и `pingall`. Первый было поставлено реализовать по заданию, а второй — для удобного тестирования программы.

ZeroMQ — прекрасная технология, мне понравилось с ней работать, ибо её API кроток и понятен. Функции описываются на довольно-таки «высокоуровневом» языке. Плюс ко всему есть «обертка», более высокоуровневая библиотека `srpzmq`, сокращающая объем кода в несколько раз. Также радует, что библиотека является кроссплатформенной.
